

The Miller Method™

IMAGE CHECKLIST FOR THE CC ***Self-evaluation***

In order to ensure maximum inclusion of breast tissue, the technologist and radiologist should consider the following criteria:

- ___ Visualization of central, subareolar and medial aspects of the breast.
- ___ Visualization of pectoral muscle on approximately 40% of cases.
- ___ PNL must measure within 1.0 cm of PNL measurement on the MLO.
- ___ Retroglandular fat is visualized behind glandular breast tissue.

The Miller Method™

IMAGE CHECKLIST FOR THE MLO *Self-evaluation*

In order to ensure maximum inclusion of breast tissue, the technologist and radiologist should consider the following criteria:

- Visualization of all breast tissue within the perimeter of breast margins.
- The position of the breast is supported up and away from the thorax (not drooping) and as close to perpendicular to the chest wall as possible.
- Retromammary fat is visualized.
- Inframammary fold is visualized and open.
- Nipple is in profile.
- Visualization of pectoral muscle: from axilla down to the level of the PNL, wide margin at axilla, convex or straight configuration and radiolucent appearance.
